

2.2. Interface

The upper left corner of the program window contains the buttons for operations with the report file, which allow to: open report file, save changes, and prepare the results for sending back. Below you can see the directory tree. To the right of the tree, you can see the directory contents pane with the navigation toolbar and search box along the top. The lower part of the program window contains the information pane.

2.3. Opening the report file

To open the report file, click the  button. In the displayed dialog, select the file received from your service center.

2.4. Saving of intermediate results

The intermediate results of customer operations in the program are saved automatically during correct exit, but you can save intermediate results by clicking the  button.

2.5. Preparing the results for sending

Clicking the  button saves the results of your operations to a file named identically to the database file and supplemented with the “_Export.roa” postfix. Send the file back to the service center.

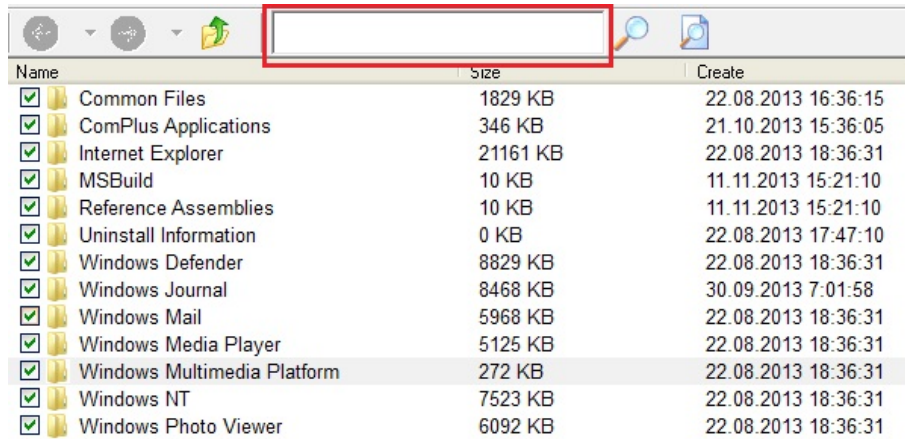

3. Description of program functionality

3.1. Selection

After the report file is opened, you can select the files and folders, which should be restored. An item is selected by clicking the area to the left of its name with the mouse or pressing the Space key if the necessary file or directory is already highlighted. Selection can be performed both in the directory tree and in the directory contents pane (at the right window side).

3.3. Quick search

The main program window offers quick search among the file and folder names. The search box can be found on the toolbar above the directory contents pane.

In the search box, you can use standard Windows search methods including the "*" wildcard. For example, the "*.txt" query will display all files with the specified extension, the "*program*" query will return all files with the names containing the "program" string, "Program Files" for example. You can specify multiple file names in the search

field using a comma or semicolon as a separator:

To search for necessary objects, just press the Enter key or click the button.

3.4. Search

In addition to quick name-based search, you can also search for directories or files using their other properties. To open the search window, click the button and specify the necessary search parameters in the displayed window, including search by name, by date (of creation, changing, opening), search by size, an search by few additional parameters.
